

Amendments to the Claims:

A listing of the entire set of pending claims (including amendments to the claims, if any) is submitted herewith per 37 CFR 1.121. This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Currently amended) A projection device for projecting an image, comprising:
 - a light source,
 - electro-optical light modulation means,
 - image projection means for projecting the image,
 - a switchable module comprising at least a first submodule switchable between being active and inactive in the light path from said light source to said image projection means, and
 - a mode selection unit ~~disposed for controlling the switchability that is~~ configured to control switching of said first submodule,
 - said first submodule being adapted to enhance centre brightness and white point of the light.
2. (Previously presented) The projection device of claim 1, wherein said module is located between said light source and said light modulation means.
3. (Previously presented) The projection device of claim 1, wherein said first submodule comprises an integrator module or a lens unit comprising two lenses.
4. (Previously presented) The projection device of claim 1, wherein said first submodule comprises colour balancing filter means for balancing the light spectrum towards the required colour coordinates.
5. (Currently amended) The projection device of claim 1, including a second submodule, and means for controlling the module in such a way that either said first or said second submodule is active in the light path.

6. (Previously presented) The projection device of claim 1, including means for controlling said module based on the type of data to be converted into an image for projection.

7. (Currently amended) The projection device of claim 6, including a second submodule, and means for activating said first submodule for video data and means for activating said second submodule for at least one of graphic and non-video data.

8. (Previously presented) The projection device of claim 1, further comprising a user interface for controlling said mode selection unit by a user.

9. (Previously presented) The projection device of claim 1, wherein said electro-optical light modulation means comprise a three-panel liquid crystal display.

10. (Currently amended) ~~The~~ A method of projecting an image, comprising:
generating light by means of a light source,
~~improving the enhancing~~ centre brightness and white point of the light by means of a first submodule,
controlling the activity of said first submodule in the light path by means of a mode selection unit,
modulating the light by means of an electro-optical light modulation means,
and
projecting the image by means of an image projection means.
